Methyl Salicylate - 119-36-8

Water Flea Data: 50 mg/L EC50 Daphnia magna 24 h

Persistence and degradability:

1. TERRESTRIAL FATE: If released on soil, methyl salicylate would readily leach. It would also be expected to partially volatilize from dry soil and photolyze on the soil surface. Based on the results of screening tests, it would be expected to readily biodegrade. Chemical hydrolysis may be important in alkaline soil. (SRC) [Peer Reviewed]
2. AQUATIC FATE: Methyl salicylate is readily biodegradable in screening tests and may be expected to biodegrade in surface waters. Methyl salicylate is expected to hydrolyze in water, the hydrolysis rate increasing with pH. At pH 7.5, its hydrolysis half-life is estimated to be 14.1 days (1,2,SRC). Methyl salicylate will react with singlet oxygen in natural surface waters resulting in a half-life of about 52 hr(3). Methyl salicylate absorbs UV radiation >290 nm and therefore may undergo direct photolysis under environmental conditions. Based on an estimated Henry's Law constant of 9.3X10⁻⁷ atm-cu-m/mol(4,5,SRC), a volatilization half-life of 49 days would be expected in a model river (SRC). [Peer Reviewed] [(1) Magid LJ, Larsen JW; J Org Chem 39: 3142-4 (1974) (2) Senent S et al; An Quim; 69:13-23 (1973) (3) Scully FE Jr, Hoigne J; Chemosphere 16: 681-94 (1987) (4) Daubert TE, Danner RP; Data Compilation Tables of Properties of Pure Compounds NY, NY: Amer Inst for Phys Prop Data (1989) (5) Riddick JA et al; Organic Solvents 4th ed; NY, NY: Wiley (1986)]
3. ATMOSPHERIC FATE: Methyl salicylate reacts with photochemically-produced hydroxyl radicals in the atmosphere resulting in an estimated half-life of 1.4 days (1,SRC). It is fairly soluble in water, 7400 mg/L(2) and may be washed out by rain. [Peer Reviewed] [(1) Meylan WM, Howard PH; Chemosphere 26: 2293-9 (1993) (2) Riddick JA et al; Organic Solvents 4th ed; NY, NY: Wiley (1986)]
 Biodegradation: Methyl salicylate in a five day BOD test exhibited a value of 55-57% of the theoretical BOD(1,2). Another 5-day BOD determination yielded 65% of the theoretical BOD(3). Methyl salicylate was completely degraded by a microbial mixture when incubated for 7 days at 30 deg C(4). Significant biodegradation of methyl salicylate in the environment would be expected from this result; however no data concerning biodegradation in natural waters or soil could be located.
